

Anni, I want to snuggle with you. I miss you so bad ❤️🥰🥰🥰

Your relatives don't seem too thrilled with the idea of me wanting you to talk to me now.

However, it is still my wish and desire that you talk to me now. Anni, I really need you now. I need you now more than ever 🥺❤️

I need to help my dad change our home's router tomorrow, and my phone data for this month is running really low. So, if I go idle or offline tomorrow, don't panic. It's just me helping my dad change our home's router. I'll also update my Discord status (the section where I say good morning) tomorrow when I'm doing it.

I have been using ChatGPT for daily cybersecurity concept refreshes for the past several months, and it doesn't seem too bad. I already have the ChatGPT Plus plan because I use ChatGPT to create tailored resumes and cover letters for each job application. Every day, it generates a mock scenario, logs, and questions for me to review to refresh cybersecurity concepts related to AWS and on-premises hybrid environments, Azure and on-premises hybrid environments, standalone AWS cloud environments, and standalone Azure cloud environments. Since it knows I am trying to find an entry-level job, and my dream job is Security Engineer/Cyber Security System Engineer, the questions it generates focus on Splunk, KQL, PowerShell, Bash, hybrid and cloud security, systems administration, SOC fundamentals, and security engineering. So far, it seems like a pretty decent low-budget concept refresher, and I can learn something here and there.

However, it doesn't really feel like something I can put on my resume to get more interviews. I can bring it up in an interview, but I need to get a better interview-to-application ratio, especially since Philly's entry-level IT job market isn't that great either.

I think that's all for today. Anni, I love you ❤️😘😘😘
